                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the protein sequence of the heavy chain of a humanised antibody of the present invention. In the variable portion, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 10D5 and the framework region originates from human germine VH segment DP-28 and 3 segment JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host
                                                                                                                                                                                                                                          Monoclonal antibody, 10D5, complementarity determining region, CDR, mouse, human; humanised antibody, antibody, Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy; neuroprotective, nootropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized 10D5 antibody, useful for the manufacture of a medicament for treating Down's syndrome, clinical or pre-clinical Alzheimer's disease or cerebral amyloid angiopathy.

```
the present sequence is the protein sequence of the heavy chain of a humanised antibody of the present invention. In the variable portion, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 1005 and the framework region originates from human germline VH segment DP-28 and J segment JH4. Novel humanised antibodies of the invention have CDRs from i005 and human framework sequences. These humanised antibodies from i005 and human framework sequences. These chamanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their capments, as well as nucleotide sequences, vectors, transformed host calls, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                요
```

This invention relates to a novel grafted antibody or its functional fragment comprising one or more complementarity determining regions (CDRs) of a defined light CDR and a heavy CDR with at least one amino acid (aa) substitution where the antibody has specific binding activity

```
conter herbicide resistance activity. Crop plants, such as soybean, cotton, tobacco, alfalfa, lettuce, maize, wheat, sorghum, rye, bananas, barley, oat, turf grass, forage grass, sugar cane, pea, field bean, rice, pine, poplar, apple, grape, citrus or nut plants, transformed with a cherbicide binding protein gene are resistant to the herbicide. Hence, weeds can be selectively controlled in a field of the transformed crops. The plants are substantially resistant or tolerant to herbicides, such as paraquat or diquat, that inhibit photosynthesis by accepting electrons cromphotosystem I thus generating free radicals which cause lipid proteins advantageously sequester the herbicide, e.g. the cell surface prevents the entry of the herbicide into the cell so at the call surface prevents the entry of the herbicide and exert any significant cytotoxic effect. The herbicide binding proteins the herbicide binding brotexis into the cell so that the herbicide cannot reach its intracellular target and exert any significant cytotoxic effect. The herbicide binding protein inhibits the
                                                                                                                                                                                                                                                                                        ö
          new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth, angiogenesis, inhibition of which is an approach therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the amino acid sequence of a mutuant mouse anti-cryptic collagen site antibody HUI77 variable region heavy chain CDR which may be used during the creation of an antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Paraquat; antibody; light chain; herbicide; resistant; crop plant; eved control; tolerant; diquat; photosynthesis inhibitor; photosystem I; free radical; lipid peroxidation; electron transport; photosystem II; vacuole; cell surface; cytotoxic; sensitive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         요
                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, all characterized by cognitive impairment. The variable region sequence is useful in producing a three-dimensional image of a 12B4 Ig, 12B4 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents a mouse 12B4 antibody variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
mobility of the herbicide from the application site to the whole plant preventing the herbicide reaching particularly sensitive organs. Additionally, tolerant plants can be produced against herbicides that have more than one target site

The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 1284 Ig variable region sequence and variable framework regions from the 1284 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, all characterized by a three-dimensional image of a 1284 Ig, 1284 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents the humanised 1284VHV1 mature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                        Immunoglobulin, Ig; neuroprotective, nootropic, gene therapy; vaccine; amyloidogenic disease; antibody; 12B4v1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                          The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, el. c.g., Alzheimer's disease, a three-dimensional image of a 12B4 Ig, 12B4 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents the humanised 12B4WHV1 sequence
                                                                                                                                                                                                                               New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunoglobulin, Ig; neuroprotective; nootropic; gene therapy; vaccine; amyloidogenic disease; antibody.

The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 1284 Ig variable region sequence and variable framework regions from the 1284 Ig variable regions sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, bown's syndrome or mild cognitive impairment, ell characterized by a three-dimensional image of a 1284 Ig, 1284 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a subject. The present sequence represents a mouse 1284 antibody variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunoglobulin; Ig; neuroprotective; nootropic; gene therapy; vaccine;
amyloidogenic disease; antibody; 12B4; chimeric.

The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel anti-human interleukin (IL)-18 rodent neutralizing monoclonal antibody having high affinity and useful for treating IL-18 mediated disorders such as multiple sclerosis, rheumatoid arthritis and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is complementarity determining region (CDR) I of the mouse antibody 1369 heavy chain variable region. The antibody has high affinity for human interleukin-18 (IL-18) and is useful for treating and diagnosing IL-18-mediated disorders, e.g. autoimmune diseases such as multiple sclerosis, rheumatoid arthritis, type I or insulin dependent diabetes, inflammatory bowel disease and psoriasis. Specific changes can be introduced into the nucleotide sequences encoding the complementarity determining regions (CDRs) or framework regions of the variable light chain and heavy chain peptides. The resulting modified or fusion nucleic acid sequences can then be introduced into a plasmid for expression

                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                      The invention relates to humanized immunoglobulin (Ig) light or heavy chains comprising variable region complementary determining regions (CDRs) from the 12B4 Ig variable region sequence and variable framework regions from a human acceptor Ig light chain or heavy chain sequence. The humanized Ig light or heavy chain or its nucleic acid molecule is useful for preventing or treating an amyloidogenic disease in humans, associated with amyloid deposits of Abeta in the brain, e.g., Alzheimer's disease, Down's syndrome or mild cognitive impairment, all characterized by a three-dimensional image of a 12B4 Ig, 12B4 Ig chain or its domain. A humanized antibody is useful for reducing plaque or neuritic burden in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                                                                                         New humanized immunoglobulin light or heavy chains comprising variable region complementary determining regions and variable framework regions, useful for preventing or treating e.g., Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fragment comprising one or more complementarity determining regions cid (as) abstitution where the antibody has specific binding activity for a defined light CDR and a heavy CDR with at least one amino acid (as) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the amino acid sequence of a mutant mouse anti-cryptic collagen site antibody HUI77 variable region heavy chain CDR which may be used during the creation of an antibody of the invention.

                                                 This invention relates to a novel grafted antibody or its functional fragment comprising one or more complementarity determining regions (CDRs) of a defined light CDR and a heavy CDR with at least one amino acid (aa) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, anglogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with anglogenesis, tumour growth and/or cancer metastasis. The present sequence is the partial amino acid sequence of a mouse antiproxytic collagen site antibody Hull maino acid sequence of a mouse anti- erryptic collagen site antibody Hull maino acid sequence of a mouse anti- erryptic collagen to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fragment comprising one or more complementarity determining regions cDRs) of a defined light CDR and a heavy CDR with at least one amino acid (as) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the amino acid sequence of a mutant mouse anti-cryptic collagen site antibody HU177 variable region heavy chain CDR which may be used during the creation of an antibody of the invention.
                                                                               grafted antibody; complementarity determining region; CDR; light CDR; heavy CDR; cryptic collagen epitope; solid tumour; new blood vessel growth; angiogenesis; tumour growth; cytostatic; collagen agonist; collagen anti-cryptic collagen; HUI77; variable region heavy chain; mouse; murine;
                                                Mouse HUI77 antibody mutant heavy chain CDR amino acid sequence SeqID90.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drug screening, antibody identification; cell signaling; inflammation; antiinflammatory; antibody engineering; humanized antibody;

```
The invention relates to methods of screening for antibodies or other agents which selectively bind to the pro-inflammatory cytokine

C differleukin-I [IL-1] to form an antagonist complex which can still bind

C to IL-1 receptor type I (IL-1R) but which cannot activate it. The agents

identified using the methods act by blocking the recruitment of the IL-1

CC receptor accessory protein (IL-1RAcP) by the IL-1/IL-1R1 complex,

CC preventing IL-1 signaling and thereby reducing inflammatory responses.

CC Description of the invention involves detecting the binding of IL-1Bapha or IL-1 beta to be an activity in cells comprising IL-1R1 and IL-1alpha or IL-

CC L1-1alpha or IL-1R1 but which decreases IL-1 activity. A second method involves detecting the test agent,

CC bind to IL-1R1 but which decreases IL-1 activity. A second method involves detecting the binding of IL-1RAcP to IL-1R1 in the presence of IL-1R1 but which decreased binding to IL-1R1.

CC involves detecting the binding of IL-1RAcP to IL-1R1 in the presence of IL-1R1 binding agents with decreased binding to IL-1R1.

CC involves detecting the binding of IL-1RAcP to IL-1R1 in the presence of a variety of acute and chronic IL-1-mediated diseases (including rheumatoid arthritis, disease, acute pencreatitis, disease, postic solve, and cute pencreatitis, disease, postic solve, and used in the treatment of a variety of disease, surgery or infection. An example of the invention describes the construction of DNA encoding the gamma heavy chain variable region (CH ammatory condition resulting from trauma, cartilage construction of DNA encoding the gamma heavy chain variable region of the IL-1beta/IL-1 receptor/IL-1RacP complex. The constructed DNA encodes a VH (ADZ47748) comprising the Kabat-defined CDRs

CC complementarity determining regions) of the murine maning and complex in the remained of the remaine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

The genes (AAQ78939-7902) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6; Y24; 3-31; M84; M118 and M31, by PCR amplification using primers AAQ78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TagI restriction enzyme. The fragments were collected. The fragments were leading the fragments were ligation products were in vitro packed and infected into E.coli 490A. The ligation products were in vitro packed and infected into E.coli 490A. The tragments were hom subcloned by colony phybridisation. The Viragments were then subcloned by colony phybridisation. The Viragments encoding them are useful in producing human immammalian hosts. The present invention describes an anti-CD16A antibody (1) comprising a VH domain comprising complementarity determining regions (CDRs) derived from the mouse 368 antibody light chain or a humanised anti-CD16A antibody (II) that lacks effector function and comprises all six CDRs of mouse antibody 368. Also described is a method (MI) for reducting a deleterious immune response in a mammal in need of such reduction, which involves administering to the mammal a CD16A binding protein comprising can Fc region derived from a human 1gG heavy chain, where the Fc region lacks effector function or is modified to reduce binding to an Fc effector ligand. (I) and (II) have haemostatic, antirheumatic, antianaemic, vasotropic, nephrotropic, neuroprotective, antiphamatory, cantianaemic, ophthalmological and antiasthmatic activities. (I) or (II) is useful for reducing a deleterious immune response in a mammal which involves administering to the mammal (I) or (II). The deleterious immune response is an inflammatory response caused by autoimmune disease such as idiopathic thrombocytopenic purpura (ITP), rheumatoid arthritis (RA), c systemic lugus erythematosus (SLB), autoimmune haemolytic ansemia (AHA), c scleroderma, autoantibody trigged utricaria, pemphágus, vasculitis syndrome, systemic arthritis, and harmaromy entities, and harmaromy entities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunoglobulin (IVIG) therapy e.g., allergic asthma. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Reiter's syndrome, Kowasaki's disease, polymyositis and dermatomyositis and also for treating diseases susceptible to treatment with intravenous immunoglobulin (IVIG) therapy e.g., allergic asthma. This is the amino acid sequence of the mature peptide from the murine anti-protein C monoclonal antibody HPC-4 heavy chain variable region. HPC 4 recognises the activation peptide region (AAR88106) of the heavy chain of protein C, a vitamin K-dependent plasma protein zymogen. Protein C is converted to activated protein C (APC) by cleavage between the Arg-Leu amino acid contained within the activation peptide sequence. HPC-4 prevents protein C activation to APC by binding to this region. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09299-302) were used to construct humanised antibodies using the PCR primers AAY09303-9. The humanised antibodies are useful as inhibitors of coagulation and can be used for the treatment of tumours by
and also for treating diseases susceptible to treatment with intravenous immunoglobulin (IVIG) therapy e.g., allergic asthma. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibitors of coagulation and can be used for the treatment or tumours by inhibiting the anticoagulant activity of APC by preventing conversion of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an anti-CD16A antibody (1) comprising a VH domain comprising complementarity determining regions (CDRs) derived CT from the mouse 3G8 antibody light chain or a humanised anti-CD16A derived from the mouse 3G8 antibody light chain or a humanised anti-CD16A antibody (II) that lacks effector function and comprises all six CDRs of conse antibody 3G8. Also described is a method (M1) for reducting a deleterious immune response in a mammal in need of such reducting, which involves administering to the mammal a CD16A binding protein comprising or Fc region derived from a human 1gG heavy chain, where the Fc region lacks effector function or is modified to reduce binding to an Fc effector function or is modified to reduce binding to an Fc effector ignand (I) and (II) have hemostatic, antitheumatic, antiansemic, vasotropic, nephrotropic, neuroprotective, antipsoriatic, cuopathic, ophthalmological and antiasthmatic activities. (I) or (II) is useful for reducing a deleterious immune response in a mammal which response is an inflammatory response caused by autoimmune disease such as idiopathic thrombocytopenic purpure (ITP), rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), autoimmune haemolytic anaemia (AHA), systemic lupus erythematosus (SLE), autoimmune haemolytic anaemia (AHA), systemic vasculitis, ankylosing spondylitis, Sjogrem's syndrome, Syndrome, Rowasaki's disease, polymyositis and dermatomyositis

Treating interleukin-1 mediated disease, by administering an IL-1 selective binding agent that binds to IL-lalpha or IL-1beta, such that the complex binds to IL-1 receptor without activating the receptor.

Example 2; Fig 6B; 39pp; English.

The invention relates to treating interleukin-1 (IL-1)-mediated disease, or blocking IL-lalpha and IL-lbeta from binding to the IL-1 receptor, involving administering an IL-1 selective binding agent (e.g. a humanised mouse anti-IL-1 antibody) that is capable of binding to IL-1 alpha or IL-1 betain the receptor. The activities of mouse chimaeric and humanised monoclonal antibody (MAD) 201 in binding to IL-1 receptor without activating the receptor. The activities of mouse, chimaeric and humanised monoclonal antibody (MAD) 201 in blocking formation of IL-lbeta/IL-1 receptor/IL-1RacP complex were studied. The results showed that anti-IL-lbeta antibody MAB201 is the most effective inhibitor of IL-lbeta signalling. The method is useful for treating IL-1-mediated disease e.g. acute pancreatitis, amyotrophic lateral sclerosis (ALS), Alzheimer's disease, cachexia, anorexia, asthma, pulmonary diseases, atherosclerosis, autoimmune vasculitis, chronic fatigue syndrome, Clostridium associated illness, coronary conditions (e.g. congestive heart failure, coronary restenosis, myocardial conferention, myocardial dysfunction and coronary artery bypass graft, cancers, diabetes, endometriosis, fever, ibromyalgia, hyperalgesia, concers, diabetes, endometriosis, fever, ibromyalgia, hyperalgesia, conferential including cerebral ischaemia, stroke, kawasaki's disease, inflammatory bowel diseases (adult respiratory distress syndrome (ARDS)), multiple sclerosis, myopathies, neurotoxicity, osteoporosis, cancer sing, myopathies, neurotoxicity, osteoporosis, panin, Parxinson's disease, periodontal disease, preterm labour, periodon injury, septic shock, side effects from radiation 

ö The invention relates to treating interleukin-1 (IL-1)-mediated disease, or blocking IL-1alpha and IL-1beta from binding to the IL-1 receptor, involving administering an IL-1 selective binding agent (e.g. a humanised mouse anti-IL-1 antibody) that is capable of binding to IL-1 alpha or IL-bleta, where the selective binding agent-IL-1 complex is capable of binding to IL-1 receptor without activating the receptor. The activities of mouse, chimaeric and humanised monoclonal antibody (MAD) 201 in blocking formation of IL-beta/IL-1 receptor/IL-1RacP complex were studied. The results showed that anti-IL-labeta antibody MAB201 is the most effective inhibitor of IL-labeta signalling. The method is useful for therapy, temporal mandibular joint disease, sleep disturbance, uveitis and inflammatory conditions resulting from strain, sprain, cartilage damage, trauma, orthopaedic surgery and infection. The present sequence is a human gremline variable region used to determine which residues or CDRs required to be changed in mouse anti-IL-1 monoclonal antibody MAB201 in order to humanise it or make it into a chimaeric molecule with human CDR (complementarity determining region) sequences Mouse; interleukin-1; IL-1 alpha; IL-1 beta; acute pancreatitis; ALS; amyotrophic lateral sclerosis; Alzheimer's disease; cachexia; anorexia; asthma; pulmonary disease; atherosclerosis; autoimmune vasculitis; chronic fatigue syndrome; coronary condition; congestive heart failure; cancer; diabetes; endometriosis; fever; glomerulonephritis; ARDS; graft versus host disease; haemorrhagic shock; inflammatory condition; inflammatory bowel disease; osteoarthritis; rheumatoid arthritis; inflammatory bowel disease; odult respiratory distress syndrome; multiple sclerosis; pain; Parkinson's disease; psoriasis; septic shock; reperfusion injury; sleep disturbance; uveitis; infection; antibody; Treating interleukin-1 mediated disease, by administering an IL-1 selective binding agent that binds to IL-1alpha or IL-1beta, such that the complex binds to IL-1 receptor without activating the receptor. New antibody that inhibits binding of a GPR64 polypeptide to an antibody comprising GPR64-18, GPR64-81, GPR64-93 or GPR64-101, useful in preparing a composition for diagnosing or treating ovarian cancer.

This invention relates to novel antibodies that bind to the G protein coupled receptor protein identified as GPR64, namely GPR64-1, GPR64-16, GPR64-18, GPR64-20 and GPR64-48. Specifically, it refers to the use of

expressing tumour cells such as those associated with ovarian cancer, uterine cancer and Ewing's sarcoma. The present invention describes epitope mapping of those antibodies that show high affinity binding to GPR64 through competitive binding analyses, such that the antibodies can be assessed for GPR64 dependent cell death in vitro. Accordingly, they famunotherapy that inhibit cellular proliferation of an ovarian cancerous cell and furthermore can diagnose and inhibit growth of tumour cells. This polypeptide is encoded by a heavy chain variable region DNA sequence of a murine anti-human GPR64 antibody of the invention. these anti-GPR64 antibodies as selective cytotoxic agents against GPR64 Sequence 120 AA; Query Match 8866666666668888

R. Hardy, R.R.

A. Bobaription: Natural autoantibodies to thymocytes: Origin, VH genes, fine specificitie

A. Bescription: S11740

A. Reference number: $11740

A. Residues: 1-122 < EMB>
A. Residues: 1-122 < EMB>
A. Residues: UNIPARC:UPI0000111D0BS; EMBL:XS3097; NID:g52368; PIDN:CAA37261.1; PIL
C. Superfamily: immunoglobulin V region; immunoglobulin homology
C. Superfamily: immunoglobulin homology < IMM>
F; 22-106/Domain: immunoglobulin homology < IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In July Chain precursor V region (IdB5.7) - mouse (fragment)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 15
AG0585
citrate utilization protein B [imported] - Salmonella enterica subsp. enterica subsp. enterica serovar Typhi
C;Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella typhi
C;Date: 09-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
C;Accession: AG0585

H90130

60s ribosomal protein L1 [imported] - Guillardia theta nucleomorph
C;Species: nucleomorph Guillardia theta
C;Species: nucleomorph Guillardia theta
A;Note: a nucleomorph is the vestigial nucleus of a eukaryotic endosymbiont
C;Date: 10-May-2001 #sequence_revision 10-May-2001 #text_change 09-Unl-2004
C;Accession: H90130

18012=P13608-2; Sequence=VSP 003072;

18012=P13608-2; Sequence=VSP 00401ar region, G3, makes up the C-terminus. G1 contains Link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, B' motifs. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2 and G3.

11nked (about 40) oligosaccharides.

11nked (about 40) oligosaccharides.

11nked (about 40) oligosaccharides.

12 TMM: The keratan sulfate contents differ considerably between adult and fetal bovine proteoglycans.

12 SIMILARITY: Contains 1 C-type lectin domain.

13 SIMILARITY: Contains 1 GF-like domain.

14 SIMILARITY: Contains 1 IG-like V-type (immunoglobulin-like)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This Swiss-Prot entry is copyright. "Analysis of the catabolism of aggrecan in cartilage explants by quantitation of peptides from the three globular domains.";
J. Biol. Chem. 266:8188-8205(1991).
-!- FUNCTION: This proteoglycan is a major component of extracellular matrix of cartilagenous tissues. A major function of this protein is to resists compression in cartilage. It binds avidly to hyaluronic acid via an N-terminal globular region. May play a regulatory role in the matrix assembly of the cartilage.
-!- SUBCELLULAR LOCATION: Secreted; extracellular matrix (By
